measure has a proper measure theory on measurable sets. A set is Lebesgue measurable if it is almost a Borel set. Existence of a nonmeasurable set for the Lebesgue outer measure is shown by the axiom of choice. 1 Measure theory 1.1 Outer measures We begin with a general definition of outer measure Let  $X$  be a set and consider

Since a major focus of this text is Lebesgue integration, it is also assumed that students have studied Riemann integration in their first real analysis course. Chapter 0 briefly covers Riemann integration with the approach that is later mimicked in defining the Lebesgue integral, that is, the use of upper and lower sums.

Then  $f$ ,  $g$  and  $fg$  are measurable, and if  $g(x) \neq 0$  for  $x \in X$ , the inverse  $1/g$  is measurable. In particular, the set of complex-valued measurable functions on  $X$  is a vector space with operations given by addition of functions and multiplication by constants.
